

Website Monitoring & Threat Detection

Sucuri's monitoring solution includes multiple scanners that cover all aspects of your website's security state. These scan components alert you the moment your website has a security issue or indicator of compromise.

Remote & Server Scanning

We crawl your server and website files to detect infections, malware and other website security threats.

Alerting Capabilities

Customizable alerts notify you via email, SMS, Slack, RSS or custom post options. We also offer SIEM integration.

Our **monitoring system** tells you when your website is hacked or has any indicators of compromise.

Security Threat Detection

We detect a variety of website issues including hacks, blacklist warnings, SEO spam injections, malicious redirects and embedded trojans.

Integrity Monitoring

Our cloud-based integrity monitoring service is fast and lightweight for any website environment.

Website Uptime Monitoring

We alert you when we detect downtime or suspicious activity such as changes to DNS, file integrity, or SSL records.

All Inclusive

Regardless of your platform or CMS, all Platform plans include robust monitoring, unlimited malware removal requests, and ongoing protection for your sites.

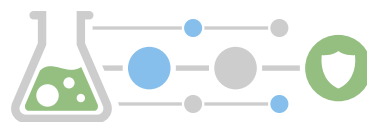

Ease of Deployment

No complicated configuration or installation. Simply activate our monitoring service using your FTP credentials. We're here to help.

Blacklist Detection

We monitor for signs of website hacks and warnings from blacklist authorities to protect your brand reputation.

Research Driven

Intelligent signatures based on code anomalies and heuristic detection identify malware and security issues.
