

# What is Sucuri Website Protection?

The Sucuri Firewall is a cloud-based WAF that stops website hacks and attacks. Providing constant research improves our detection and mitigation of evolving threats. You can even add your own custom rules.

## Virtual Patching & Hardening

With the firewall surrounding your website, patches and server rules are constantly updated by our researchers.

## Application Profiling

We analyze all types of traffic and block requests that don't fit your website application's profile.

Sucuri offers **protection** against zero day exploits, complex hack attempts, brute force, and DDoS.

## DDoS Mitigation

The Sucuri Firewall detects and blocks all types of DDoS to guarantee uptime and website performance in the event of a large attack.

## Brute Force Protection

Stop unauthorized login attempts on your critical website access points. The Sucuri Firewall protects against a variety of complex attack sequences.

## Easy Setup & Customization

No complicated configuration or installation. Simply switch your DNS A-record. Our dedicated analysts can help with any custom requirements.

## Machine Learning

Attack data is correlated to understand and anticipate malicious behavior and protect sites from emerging threats.

## Signature Detection

If we detect malicious patterns, we block it. All incoming traffic is sanitized before it ever reaches your website.

## Bot Blocking

When our system detects a malicious bot or hacker tool trying to attack your site it is blocked automatically.

## Whitelisting

Manage and whitelist approved IP addresses to ensure that your team can access website administrative panels.
